<p>I. CIRCUIT DESCRIPTION</p> <p>This circuit board is designed to provide the Sequential Logic that is necessary for testing of the Thrust Bearing Wear Detector. There are two redundant circuits on this board; one to test the Upper Thrust Bearing Wear Detector and one to test the Lower Thrust Bearing Wear Detector.</p> <p>The circuit board is identified as follows:</p> <table border="0"> <tr> <td>TBWD Test Logic -- 1TM2-S201</td> <td>Schematic - 145D2479</td> </tr> <tr> <td></td> <td>Assembly - 186C8150 G1</td> </tr> </table>				TBWD Test Logic -- 1TM2-S201	Schematic - 145D2479		Assembly - 186C8150 G1	<p>REVISIONS</p> <p>1 PAULIS SEP 8 1982</p> <p>chgs made</p>

III. CIRCUIT OPERATION (continued)

B. Power Supply (continued)

1. Connect +24 VDC to Pin 38.
2. Connect 24 VDC common to Pin 40.
3. Note that DSL (GN) is lit.
4. Measure +5 VDC ± 5.0% between TP2 (+) and TP1 (-).
5. Measure +24 VDC ± 5.0% at output Pins 18, 20, 22, 24, 26, 28, 30 and 32. These measurements represent the initial power-up state of the board as it will be in the EHC cabinet.

C. Timer Test

1. Momentarily apply +24 VDC to Pin 3.
2. Measure the duration of a TTL high level pulse (approx. 3.5 to 5 VDC) at TP50. This pulse should last 3 seconds + 10% from the time the +24 VDC signal is removed from Pin 3.
3. Momentarily apply +24 VDC to Pin 7.
4. Measure the duration of a TTL high level pulse at TP51. This pulse should last 3 seconds + 10% from the time the +24 VDC signal is removed from Pin 12.

D. Logic Truth Table

The following truth table should be used to perform a functional test of the circuit board logic. Input signals that are indicated as being at logic level "0" do not have to be tied to +24 VDC common.

Logic Level Definition

1. - +24 VDC + 5.0%

0 - +24 VDC Common
