224X673AA	REVERSE LOGIC CARD TEST INSTRUCTIONS	2	1
CONT ON SHEET	FIRST MADE FOR		
2	193X185AAG01		

1.0 SCOPE

This instruction covers the test procedure for production testing of the 193X185AAG01 reverse logic card. Test conditions are given in Section 3.0. Performance is covered in Engineering Specification 224X329AA.

2.0 INSTRUCTIONS

In these tests a "high" (H) refers to 3.5 to 5.25 volts. A "Low" (L) refers to zero to 0.5V.

2.01 REVERSING

Run through the following truth table in sequence. Tabs 9 and 12 need not be checked after the first three steps.

Input Conditions						Output Check		
Tab 14	Tab 16	Tab 13	Tab 6	Tab 5	Tab 17	Tab 8	9	11 12
H	L	H	H	L	H	-	-	-
H	L	H	L	H	L	H	L	H
L	H	H	L	H	L	L	H	L
		L		L	L			
			Pulse H		Pulse H			
			L		L			
		H	L	H	L			
			Pulse H		L			
			L		Pulse H			
				L	L			
				Pulse H	L			

2.02 LINEAR TIMING

Turn both pots P477 and P478 full clockwise. Short Tab 5 to common. Place a -10 volt step into Tab 19. Tab 10 should take more than 35 seconds to time up to +10 volts (± 25 volts). Remove the -10 volts to Tab 19 and Tab 10 should take more than 35 seconds to time down to zero.

2.03 REFERENCE CLAMP

Again apply -10 volts to Tab 19. Then apply a +3 volts to Tab 30 and the Tab 10 should settle to a final value between zero and -1 volt.

2.04 REVERSING CLAMP

With -10 volts applied to Tab 19 and Tab 5 open, short Tab 13 to common. Tab 10 should time to a final value between zero and -1 volt. Momentarily short Tab 5 to common, Tab 10 should return to +10 (± 25 V). Now open Tab 13, Tab 10 should again go to 0 to -1V
