## Functional test procedure for a Static Break Control Card

### 1. SCOPE

1.1 This is a functional testing procedure for a Static Break Card.

### 2. STANDARDS OF QUALITY

2.1 Refer to the current revision of the IPC-A-610 standard for workmanship standards.

### 3. APPLICABLE DOCUMENTS

3.1 The following document(s) shall form part of this specification to the extent specified herein. Unless otherwise indicated, the latest issue shall apply.

3.1.1 **GEI-100184**

3.1.2 **Documentation Folder for DS2020BRCA**

3.1.3 **Documentation Folder for DS200SBCA**

### 4. ENGINEERING REQUIREMENTS

#### 4.1 Equipment Cleaning

4.1.1 Equipment should be clean and free of debris prior to applying power unless performing an initial check. Refer to the local documented procedures for cleaning guidelines.

#### 4.2 Equipment Inspection

4.2.1 Equipment should be visually inspected for any defects prior to applying power. This inspection should include the following as a minimum:

4.2.1.1 Wires broken or cracked

4.2.1.2 Terminal strips / connectors broken or cracked

4.2.1.3 Loose wires

4.2.1.4 Components visually damaged

4.2.1.5 Capacitors leaking

4.2.1.6 Solder joints damaged or cold

4.2.1.7 Circuit board burned or de-laminated

4.2.1.8 Printed wire runs burned or damaged

### 5. EQUIPMENT REQUIRED

5.1 The following equipment is required to perform the process requirements. Equipment may be substituted provided that all accuracy's and test ratios are equivalent or better.

-------------------------------------	---	--------------------

Qty	Reference #	Description
1		Fluke 85 DMM (or Equivalent)
1		Inductive Load
1	H033818	Brake Control test Unit
1		Oscilloscope w/probes
1		220/440VAC Power Source

## 6. TESTING PROCESS

### 6.1 Setup

#### 6.1.1 Switch Setup (\* - indicates dot down)

#### 6.1.2 Jumper Setup

JP1	JP2	JP3	JP4	JP5	JP6	JP7
2-3	1-2	1-2	1-2	1-2	1-2	1-2

**Note:** If you wash the unit prior to testing it is very important to let it bake for at least 24 hours.

**6.1.3** Connect single-phase 240VAC supply to fuses on test unit. Also connect 220/440 converter input to 240VAC supply. Put converter switch in 220 position. Plug in oscilloscope to converter outlet.

**6.1.4** Connect 41-ohm inductive load (blue unit) to terminals 4 & 5 of large terminal strip on test fixture. Connect a DC meter across the load.

**6.1.5** Connect UUT to test fixture, noting connecting points on test card as it is disconnected.

## 6.2 Testing Procedure

- 6.2.1 Apply 240 VAC power to unit and verify that “FLT” and “PWR” LEDs illuminate.
- 6.2.2 Verify  $\pm 15\text{VDC}$  and  $\pm 24\text{VDC}$  at test pins on card to com pin.
- 6.2.3 Set scope for 2ms/Div and 5V/Div and make the following checks.
  - 6.2.3.1 Verify a 25-30VPP square wave with a 50% duty cycle at pin 7 of U17.
  - 6.2.3.2 Verify a 14-19V Peak with an on time of about .2 msec at pin 10 of U15.
  - 6.2.3.3 Verify a 10V Peak sawtooth wave with a 4msec rise time at the cathode of D23.
  - 6.2.3.4 Verify a 14-19V Peak signal with an on time of about .2 msec at test pin “OSC”.
- 6.2.4 Input 5VDC between 2TB-1(-5vdc) and 2TB-5(com) and make the following measurements.
  - 6.2.4.1 Verify with a DVM +5VDC( $\pm 1\text{V}$ ) at test pin “REFX”.
  - 6.2.4.2 Verify with a DVM +3.5VDC( $\pm 1\text{V}$ ) at test pin “REFB”.
  - 6.2.4.3 Verify with a DVM +5VDC( $\pm 1\text{V}$ ) at test pin “REFA”.
  - 6.2.4.4 Remove input from 2TB-1 and 2TB-5
- 6.2.5 Remove 240VAC power and place a jumper between 2TB-2 and 2TB-5.
- 6.2.6 Apply 240VAC power and verify that all LED's illuminate and the “FLT” and “RLS” LEDs go out after about 5 seconds
- 6.2.7 Remove 240VAC power and move jumper to 2TB-3 and 2TB-5.
- 6.2.8 Apply power and verify that all LED's illuminate and stay on. There will be over 100VDC at output.
- 6.2.9 Remove 240VAC and connect an Oscilloscope with 100X probes in differential mode to the load terminals; reapply 240VAC and check for waveform similar o Figure 1
- 6.2.10 Remove 240VAC power and move jumper to 2TB-4 and 2TB-5.
- 6.2.11 Apply 240VAC and verify that “FLT” and “PWR” LEDs are on and “RLS” LED is off.
- 6.2.12 Starting with 0VDC apply a negative voltage to 2TB-1 with 2TB-5 (com).
- 6.2.13 Verify that “RLS” LED illuminates at -.5 to -1.1VDC input.

<p><b>LOU-GED-DS200SBCA REV. D</b></p>	<p><b>g</b></p> <p><b>GE Industrial Systems</b> Renewal Services Louisville, KY</p>	<p><b>Page 6 of 6</b></p>
--	---	---------------------------

**6.2.14** Verify that “FLT” and “RLS” LEDs go out at –6 to –7VDC signifying a fault. With an ohmmeter check for a short between 1TB-5 and 1TB-7 and an open circuit between 1TB-5 and 1TB-6.

**6.2.15** Reduce input to 0VDC and remove 240VAC.

**6.2.16** Reapply 240VAC to reset fault and then verify short between 1TB-5 and 1TB-6.

**6.2.17** Verify OPEN between 1TB-5 and 1TB-7.

**6.2.18** Verify smooth control of output waveform while increasing input on 2TB-1 from zero to –6VDC. Output DC volts should be over 200VDC.

### **6.3 \*\*\*TEST COMPLETE\*\*\***

## **7. NOTES**

**7.1** None at this time

## **8. Oscilloscope Verification Examples**

### **8.1**
